

Projects

Follum Fabrikker, Norske Skogindustrie SA

One of the largest pulp and paper production facilities in Norway.

Follum Fabrikker's existing fluorescent luminaires were a maintenance problem with corrosion and inefficient light output due to the high ambient and humid conditions associated with this type of industry. A solution was needed to reduce the maintenance cost and provide a safer working environment.

The combination of Compact 65 with a narrow light distribution at a mounting height of 9.5M and A-Line fluorescent for emergency lighting provided Follum with lux levels that exceeded their expectations. The bodies of both luminaires being constructed from aluminium are cool running and anti-corrosive which were ideal for the arduous conditions associated with this paper production plant.
